The ICALP program can be divided into two tracks, viz. track A (algorithms, automata, complexity, and games) and track B (logics, semantics, and theory of programming). In response to the Call for Papers, the program committee received 212 submissions: 131 for track A and 81 for track B.

Automata Theory 1 Automata "What is it? The term "Automata" is derived from the Greek word "αὐτοματίζω" which means "self-acting". An automaton (Automata in plural) is an abstract self-propelled computing device which follows a predetermined sequence of operations automatically.

### **About this Tutorial**

The notes are designed to accompany six lectures on regular languages and finite automata for Part IA of the Cambridge University Computer Science Tripos. The aim of this short course will be to introduce the

mathematical formalisms of finite state machines, regular expressions and grammars, and to explain their applications to computer languages.

Automata-based programming is widely used in lexical and syntactic analyses. [1] Besides that, thinking in terms of automata (that is, breaking the execution process down to automaton steps and passing information from step to step through the explicit state ) is necessary for event-driven programming as the only alternative to using parallel processes or threads.

Context-free grammar (CFGs) are used in programming languages and artificial intelligence. Originally, CFGs were used in the study of the human languages. Cellular automata are used in the field of biology, the most common example being John Conway's Game of Life. Some other examples which could be explained using automata theory in biology include mollusk and pine cones growth and pigmentation patterns.
