

## **bridge substructure and foundation pdf**

A bridge is a structure built to span physical obstacles without closing the way underneath such as a body of water, valley, or road, for the purpose of providing passage over the obstacle, usually something that can be detrimental to cross otherwise. There are many different designs that each serve a particular purpose and apply to different situations.

## **Bridge - Wikipedia**

The substructure is made of multiple parts as well: An abutment is the foundation that transfers the bridge structure to the roadway or walkway on solid ground. A pier is an intermediate support.; The cap is the part that supports the bearing pads. Depending on the type of support structure, there may or may not be a cap. Wall piers and stub abutments do not require a cap, while a multi-column ...

The bearings are usually supplied with the bridge unless excluded within the order. The term "bearings" is more appropriately defined as "bearing device" and usually means everything conveying load between the superstructure and the substructure and includes a "load plate" also known as a "sole plate", a bearing pad made from reinforced elastomers or resins, and a steel ...
