An intrusion detection system (IDS) is a device or software application that monitors a network or systems for malicious activity or policy violations. Any malicious activity or violation is typically reported either to an administrator or collected centrally using a security information and event management (SIEM) system. A SIEM system combines outputs from multiple sources, and uses alarm ...

In computing, a firewall is a network security system that monitors and controls incoming and outgoing network traffic based on predetermined security rules. A firewall typically establishes a barrier between a trusted internal network and untrusted external network, such as the Internet.. Firewalls are often categorized as either network firewalls or host-based firewalls.

## **Firewall (computing) - Wikipedia**

In Figure 1, a network layer firewall called a "screened host firewall" is represented. In a screened host firewall, access to and from a single host is controlled by means of a router operating at a network layer. The single host is a bastion host; a highly-defended and secured strong-point that (hopefully) can resist attack.

Prerequisites: This tutorial assumes that a computer has Linux installed and running. See Red Hat Installation for the basics. A connection to the internet is also assumed. The tasks must also be performed with the root user login and password. The computer is most vulnerable to attack through network exploits.
