A numerical method is said to be convergent if the numerical solution approaches the exact solution as the step size  $h$  goes to 0. More precisely, we require that for every ODE (1) with a Lipschitz function  $f$  and every  $t^* > 0$ ,  $\forall \epsilon > 0, \exists \delta > 0$  such that  $\forall h < \delta$ ,  $\forall t \in [0, t^*]$ ,  $|\hat{y}_n(t) - y(t)| < \epsilon$ . All the methods mentioned above are convergent.

Numerical analysis is the study of algorithms that use numerical approximation (as opposed to general symbolic manipulations) for the problems of mathematical analysis (as distinguished from discrete mathematics). Numerical analysis naturally finds application in all fields of engineering and the physical sciences, but in the 21st century also the life sciences, social sciences, medicine ...

Pavel, I just wanted to say how much I enjoyed finding this resource as I am taking my first course in numerical differential equations. I am having some confusion based on the definitions for the central difference operator that I am given and the one you are using.

Hi Pavel. Nice work. I'm using it now to compute the velocity of a robot (MBARS) and your methods give very good results. I'd like to know if you have the formula of a one-sided version, as using a centered version forces me to introduce a time lag.
