Wind power is the use of air flow through wind turbines to provide the mechanical power to turn electric generators. Wind power, as an alternative to burning fossil fuels, is plentiful, renewable, widely distributed, clean, produces no greenhouse gas emissions during operation, consumes no water, and uses little land. The net effects on the environment are far less problematic than those of ...

Wind is the flow of gases on a large scale. On the surface of the Earth, wind consists of the bulk movement of air. In outer space, solar wind is the movement of gases or charged particles from the Sun through space, while planetary wind is the outgassing of light chemical elements from a planet's atmosphere into space. Winds are commonly classified by their spatial scale, their speed, the ...

Germany decided to go nuclear-free by 2022. A CO<sub>2</sub>-emission-free electricity supply system based on intermittent sources, such as wind and solar “ or photovoltaic (PV) “ power could replace nuclear power. However, these sources depend on the weather conditions. In a new study published in EPJ ...

This post reviews the weird and wonderful world of high altitude wind power. It looks into the reasons for wanting to go high, explains tethered flight and explores the main competing technologies of 1) airborne generation (Google Makani) and 2) ground based generation (KiteGen) and compares their strengths and weaknesses.

I. Introduction. Today's energy literature appears to be proclaiming that “baseload energy is dead,” and sometimes argues that variable energy resources are able to meet all or nearly all of the power needs of future electricity systems. 1, 2 On the contrary, it has been a well-established energy industry best practice for decades to value a diverse mix of electricity sources in order to ...

How does a wind turbine work? Wind (moving air that contains kinetic energy) blows toward the turbine's rotor blades.; The rotors spin around, capturing some of the kinetic energy from the wind, and turning the central drive shaft that supports them.

With modern power electronics about 1% of the power is lost in each of the two converters for an HVDC

interconnect. Since the distances out to the off shore wind farms is short, maybe another 1% in line losses.

Adventures in Attacking Wind Farm Control Networks. Wind farms are becoming a leading source for renewable energy. The increased reliance on wind energy makes wind farm control systems attractive targets for attackers.
